

ABSTRACT OF THE DISCLOSURE

A seat belt cover comprising a flat tubular member through which a seat belt of a motor vehicle is passed to be covered therewith, wherein, the flat tubular member has i) a slit-shaped opening provided at its lower end and having a width larger than the width of a through-tongue and ii) a slit-shaped opening provided at its upper end and having a width which is enough to pass the seat belt but not enough to pass the through-tongue. Also disclosed is a seat belt cover provided with a pocket for, e.g., a cellular phone on the outside. The former seat belt cover can prevent the friction of a seat belt with clothes to keep the shoulder or breast of a coat or jacket from becoming shiny and wearing. The latter seat belt cover enables, e.g., safety driving in talking over the cellular phone during the driving of a motor vehicle.
